

## PREPAIR in pills

### DURATION

From February 1st 2017 to January 31st 2024.

### TOTAL BUDGET

17 million euros available to invest in 7 years: 10 million of which coming from the European Life Program.

### COMPLEMENTARY FUNDS

PREPAIR is an "integrated" project: over 850 million euros coming from structural funds and from regional and national resources of all partners for complementary actions related to air quality.

### AIR QUALITY PLANS

The project will contribute to the implementation of each partner's air quality plan and of the measures of the Po Valley Agreement on a wider territorial scale.

### STAKEHOLDER BOARD

Each partner will establish a Stakeholder Board involving local authorities, environmental and socio-economic associations as well as research and training institutions interested in following the development of the project's activities.

## PREPAIR project: the Po basin together against air pollution

Over 23 million people – representing the 40% of the Italian population – live in the regions of the Po basin, where over the 50% of the national GDP is produced.

The problem of air pollution in the Po basin crosses regional borders and as such it requests an over-regional approach: implementing integrated and coordinated measures on a wider area is therefore necessary in order to lower the concentration of pollutants in the atmosphere. This is the aim of PREPAIR: to promote new lifestyles, production and consumption models that can really affect an emissions' reduction. A strategic and wide-ranging project on different levels: not only for its territorial dimension, extended to the whole Po basin area and the Slovenian territory, but also for its economic and temporal dimension, as the project will develop until January 2024.

### AGRICULTURE

The project foresees the development of a common evaluation tool for the reduction of emissions in the farms, promoting the dissemination of good practices on the use of fertilizers through also a system of assistance to farmers in order to optimize its spreading by using low-emissions techniques.

### ENERGY EFFICIENCY

About energy efficiency and the production of renewable energy, the project plans to provide guidelines for small and medium enterprises, to develop an integrated approach to all actors involved in the chain of condos, and to realize local info-points in support of public bodies for promoting the green public procurement.

### BIOMASS

PREPAIR foresees specific education and qualification actions for freelancers on the design, maintenance and control of domestic wood-burning plants and awareness-raising activities for citizens on good practices. It also aims at optimizing the local supply chain of biomass.

### EMISSIONS EVALUATION AND MONITORING

Within the concrete actions foreseen in the project there is the realization of a permanent platform for data sharing, the monitoring and the evaluation of air quality in the Po basin, including the effects of the cross-border pollution between Italy and Slovenia.

### TRANSPORTS

The Po basin is characterized by a great vehicular mobility producing polluting emissions. In the field of transports, PREPAIR aims at developing common tools for the support of the public, electric and cycling mobility and for a rational management of the transport of goods, also by adopting pilot and demonstrative actions.

### COMMUNICATION AND NETWORKING

Specific communication actions addressed to public operators, privates and local communities are foreseen. Networking is particularly important for sharing and capitalizing other projects' results, for avoiding overlapping and for strengthening the synergies between different initiatives.
